

Mixed Signal Virtual Components
Meeting the challenge of Design Reuse and
Time-To-Market thanks to
a flexible high resolution ADC generator

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

Overview of the presentation

- Introduction: **Design Reuse** and **Time-To-Market**, a challenge for **Mixed Signal** VCs
- **ADMIR** or how to answer such a challenge with a high resolution ADC generator
 - ❖ Main characteristics and **flexibilities** for various application requirements
 - ❖ The **generator** approach enabling these flexibilities
 - ❖ What is delivered to a customer?
 - ❖ How Dolphin may **retarget** to different CMOS processes **within a few weeks**
 - ❖ **Efficiency** of such a retargeting (performances and cost)
- Conclusion and trends

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

Introduction

- **Design Reuse and Time-To-Market**, a real challenge for **Mixed Signal** Virtual Components
 - ❖ Users often (always?) need a solution « slightly » different from mixed signal macrocells available (sometimes) in a library.
 - ❖ In analog, the difference between a completely new design and modifications of an existing one may be very thin!
 - ❖ Users often (always?) need the VC in a process requiring a **retargeting work**. In analog, such a retargeting work may consume a lot of human and computer resources and the original designer is now working on other projects!
 - ❖ When building a **System On Chip**, users always expect receiving the analog VC data base **simultaneously with the rest of the logical design**, within a **very short time**
- How to answer such challenge?

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

Case-study

- How to cover a wide range of characteristics for an ADC with following features?
 - ❖ Delivered as a Virtual Component **within a short time**
 - ❖ **Retargetable towards any submicron 3V CMOS process, analog or digital within a short time**
 - ❖ Able to cover **various characteristics** like:
 - Number of input channels between 1 and 12
 - For each channel, a **resolution from 10 to 16 bits** with a sampling frequency from DC to 50 kHz
 - Differential or single-ended inputs
 - Single power supply voltage 3V
 - And many other features...

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

The Dolphin response: ADMIR

- Based on a **generator** approach:
 - ❖ The user specifies its needs by answering questions through a user interface
 - ❖ The generator evaluates and proposes different solutions
 - ❖ The generator generates the chosen solution, a « **cut** », optimized for the required performances and provides ready-to-use deliverables of this **cut**
- Based on an efficient **retargeting methodology** which guarantees **short schedule** for **porting** in a new technological CMOS process
- This work has been sponsored by the European Community: Esprit project NAOMI

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

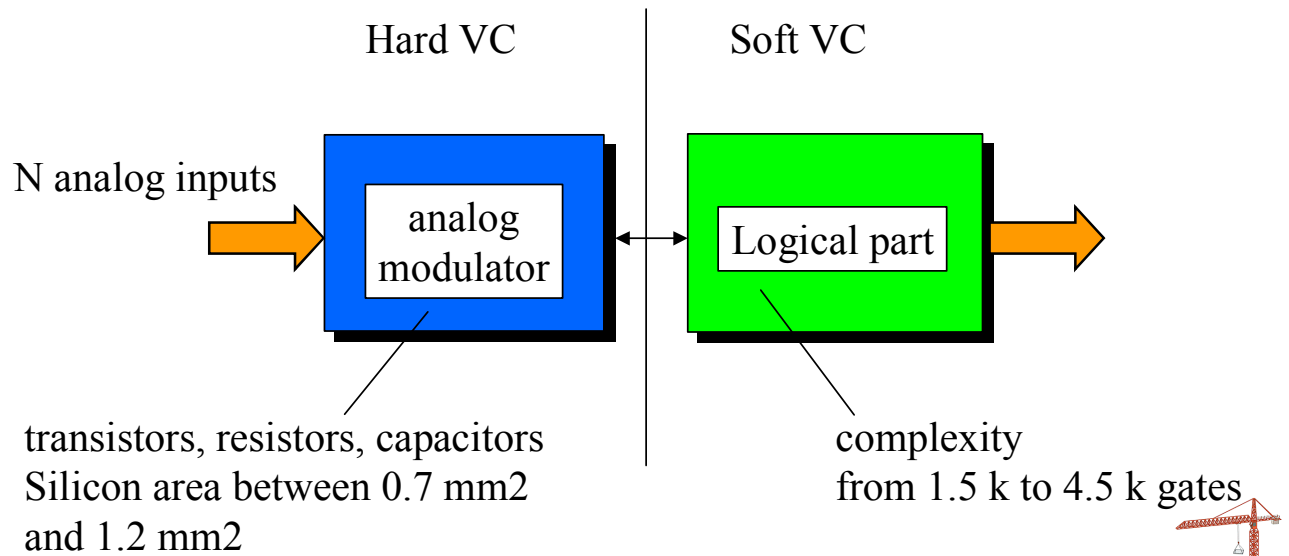

Réponses du générateur

silicon area of the analog part
estimated number of gates of the digital part
frequency of the main clock per channel
actual table for Ncodes, DNL, INL, ... and DECIM value
power consumption

ADMIR

A « cut » is a mixed signal VC

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

ADMIR - working area of the generator

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

ADMIR

Flexibilities and main features

■ Flexibilities

- ❖ The number of analog input channels = N between 1 and 12
- ❖ For each analog input: fixed or programmable
- ❖ For fixed inputs: #codes, INL, DNL, Fs, choice between differential / single ended,
- ❖ For programmable inputs: #codes, INL, DNL, Fs, the choice between differential and single-ended remains possible during the working mode
- ❖ The use of internal or external voltage reference
- ❖ stand-by, shut down and normal modes
- ❖ zero tuning mode for an offset-cancellation of each channel separately

■ Application fields: Data acquisition, measurement, sensors...

ADMIR - Interface Dolphin-Customer

- The Customer describes to Dolphin the features of a required ADC by answering a set of questions
- Dolphin runs the generator and proposes the possible cuts and associated data sheets
- After agreement on the right data-sheet, Dolphin generates the selected cut and provides the deliverables to the customer

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

ADMIR

Deliverables for a cut

- In accordance with **VSIA** specifications
- For the logical part
 - ❖ Synthesizable Verilog RTL Code
 - ❖ Verilog Testbench and test vectors
- For the analog part
 - ❖ Abstract for Place and Route
 - ❖ GDSII data base including all mask layers, in accordance with the targeted process design rules
 - ❖ Spice Netlist
 - ❖ Analog behavioral model (ABCD) on request
- For both
 - ❖ Datasheet and detailed specifications
 - ❖ User's guide

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

ADMIR: benefits for the Customer

- Enables to cover a **wide range of customers needs** thanks to a lot of flexibilities
- Satisfies both **Design-Reuse** and **Time-To-Market** criteria
- a specific cut is available **within some minutes** in an already predefined process
- What about the retargeting in a new process?
 - ❖ ADMIR generator has been designed for easy retargeting towards any submicron 3V process
 - ❖ Either the whole generator or a single cut may be retargeted
 - ❖ In any case, the deliverables will be possible within a short delay, compatible with usual requirements from customers

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

ADMIR Retargeting: how is the generator built?

- Logical part generation
 - ❖ ADMIR generators uses three different RTL parametrized models, associated to the analog modulators
 - ❖ When the generators selects one cut, one RTL model is chosen
- Retargeting the logical part does not need additional design work thanks to the use of a RTL synthesizable model in HDL
- Data sheet generation
 - ❖ ADMIR generator uses a « meta » data sheet and fills the values when the cut is selected; values are issued from the simulation files
- Retargeting the data sheet only requires having done the retargeting of analog part

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

ADMIR Retargeting: how is the generator built?

- Analog part generation
 - ❖ ADMIR Generator uses 13 different basic hard cells: AOP, comparators, bandgap, phase generators
 - ❖ Basic cells are used by 6 different hard modulators
 - ❖ When the generator selects one cut, one modulator is chosen
 - ❖ An Analog Test Bench is associated with each cell and each modulator
 - Simulation configuration
 - Stimuli
 - Data sheet with parameters to extract
- Analog part retargeting = schematics retargeting
+ layout retargeting

Retargeting methodology

- same schematic
- similar specifications
- a priori sizing
- fine tuning
- semi-automatic layout porting
- manual correction

Retargeting - Sizing step

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

Analog test bench

Robust design rules including:

use of in-house generic device models with a wide variation range on key parameters (threshold, mobility, oxide thickness)

use of robust schematics avoiding process dependant effects

rules for the layout and visual control for symetries, mismatch influences, power supplies lines, critical signals crossing, isolation between analog and digital

hierarchical approach

by design the global specification is met when every sub-cells specification is met

A priori sizing

depends on:

the sub-cell itself

the gap between the initial and final technologie

the gap between the initial and final specification

usually:

systematic sizing on digital part (phase generator, decoder, ...)

specific sizing on analog cells (output stage of the OAP, switches, capacitors, ...)

Sizing -example of the capacitors

- **Process A- 0.5 μm**

poly/m1/m2 sandwich capacitor

=> $126 \pm 14 \text{ aF}/\mu\text{m}^2$ (parasitic: 68%)

- **Process B- 0.35 μm**

poly/m1/m2/m3 sandwich capacitor

=> $120 \pm 13 \text{ aF}/\mu\text{m}^2$ (parasitic: 76%)

=> sizing coefficient: 1.05

- **Process C- 0.35 μm**

m1/m2/m3 sandwich capacitor

=> $126 \pm 43 \text{ aF}/\mu\text{m}^2$ (parasitic: 30%)

=> sizing coefficient: 1

Retargeting - Layout

Mix of **vertical** and **horizontal** retargeting

- vertical retargeting uses systematic sizing of some devices
- horizontal retargeting uses specific sizing

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

hierarchical approach

start from existing layout

graphic resizing with **GDS Strata™**

manual finishing

use our own graphic rules for a set of technologies to simplify the retargeting

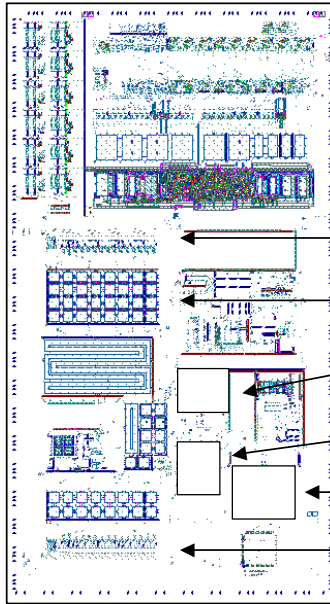

Layout retargeting

IP98 - Mixed Signal Virtual Components - October 26-27, 1998 - DOLPHIN INTEGRATION

Conclusions and trends

- Thanks to the Dolphin know-how in mixed-signal design:
 - ❖ We have proposed a **new concept: generator of Virtual Components**, for better answering Customer expectations: **various needs and Time-To-Market**
 - ❖ We have demonstrated the **efficiency** of **retargeting** methodology to **shorten design cycles**
 - ❖ **ADMIR** features may be extended: decreasing power consumption, increasing sampling frequency or resolution...
- The generator concept may also be applied to other mixed signal VCs like PLLs, DACs, Codecs...
- The continuous progress in retargeting methodology will more and more reduce the Time-To-Market for mixed signal VCs and extend their use in SOC design.
